

ABSTRACT OF THE DISCLOSURE

A customized and configurable analysis system is disclosed for analyzing data captured from a wide variety of different sources, such as an asset management application. Regardless of the particular embodiment, the analysis system provides users with the ability to modify and customize the underlying data design to enhance the analytical functionality of the analysis system. The modification of the data design occurs through the use of various templates that are part of the user interface for the analysis system. Thus, persons without specialized database and data architect expertise can modify underlying data design in a timely and inexpensive manner.
